

Flywheel

The growth agent that never stops testing

Reads your product's logs, ships UX fixes, runs the A/B test, and keeps the version that wins — closing the loop from data to decision to code, one round at a time.

Jessica Wang · Product & Market

Bob Zhang · Engineering

THE PROBLEM

Nobody has time to read the logs

Indie developers & small teams

No dedicated data analyst or UX designer. Experience improves by gut feeling — or not at all.

Enterprise department owners

Internal tools and dashboards go years without UX investment. No budget for A/B testing, and mistakes are costly.

Result: friction is discovered on a monthly cycle — if it's discovered at all.

HOW IT WORKS

A six-step loop that runs on its own

1

Perceive

Turn raw session logs into a funnel and friction signals.

2

Diagnose

Rank hypotheses by expected impact, with evidence cited.

3

Implement

Ship the fix on an isolated candidate — full stack, not just UI.

4

Evaluate

Run an A/B test against baseline; guardrail metrics too.

5

Decide

Auto-adopt low-risk wins; route high-risk ones to a human.

6

Repeat

The winning version becomes next round's baseline.

Step 6 feeds back into step 1 — the loop never stops

03 / 05

Three guardrails before anything ships

The hard part isn't writing code — it's making sure the agent can't break things, or grade its own homework.

Smoke test first

Every change must pass an automated walkthrough before it's even eligible for an A/B test.

Win, and don't break anything

Must beat the baseline with statistical significance while error rate and latency stay flat.

Risk-tiered rollout

UI and copy changes auto-deploy. Anything touching payments or auth waits for human approval.

Its own tests are read-only

The agent can never modify the evaluation code or simulator that scores it.

Beachhead first, enterprise ceiling

Beachhead

Indie developers & OPCs

No designer, no analyst — one person says yes, and ROI ties straight to conversion lift.

Channel: Product Hunt, Indie Hackers, dev X/Twitter — launch using our own funnel lift as the case study.

Expansion

SaaS growth & product teams

Automates the loop from measurement to shipped fix, alongside tools like Amplitude.

Channel: integrations with existing analytics tools, PLG & growth communities.

Ceiling

Enterprise department owners

Approval-gated autonomy: audit trail, risk tiers, pilot-friendly rollout.

Channel: pilot programs, digital-workplace procurement, direct sales.

A 24/7 teammate that never gets tired — and always knows when to ask a human first.
